Hibernation Toss and Sort Game

Directions: Cut out the game cards and hole-punch them in the space provided. Then, use yarn to attach the cards to the balls. I have left several blank cards for you to add your own clues on as well. Attach the fact cards to the 2 jugs.

Game Play: Mix up all the balls. Have your child or student pick the balls up one-at-a-time. Once they determine which category of facts the ball is in, have them toss the ball into the proper bin. Once they are done, review the facts with them. They earn one point for each one they put in the correct category.

Hibernation

Pass the winter sleeping.	Natural process like sleep.
Eat a lot of food in the fall.	Body temperature is greatly reduced.
Heart rate is lower.	Can wake up for short times, but generally sleeps all winter.
All senses are dulled.	Covered dens afford long term protection.
Happens in places with cold winters.	Happens when food is scarce.
Can birth their young during the winter.	Not always triggered by cold weather.

Non - Hibernating Animals

Hunter during winter.	Gathers food to eat all winter.
Can travel great distances for food.	Must keep active to stay warm.
Group together to hunt and keep warmer.	Can be active during the day.
Can be active during the night.	Tend to move to warmer climates.
Tend not to birth their young in winter.	Eat different types of food than normal.
Sleep longer, but search out food and water most days.	Tend to be skinnier with less fat.
